General

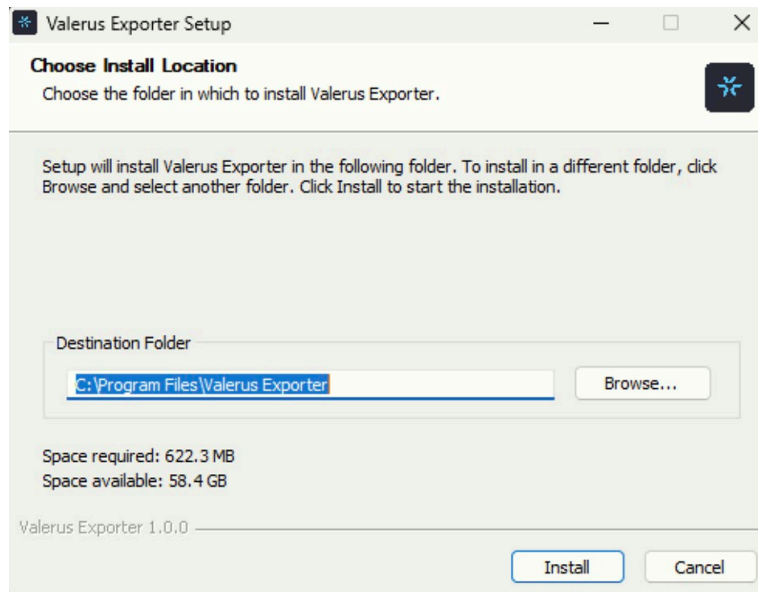

For those users who need to export large video files, Valerus provides an Exporter Tool that is optimized for export. No player is required and the tool offers a faster and easier method to export files and save them anywhere required.

Follow the steps below to install and use the Exporter Tool.

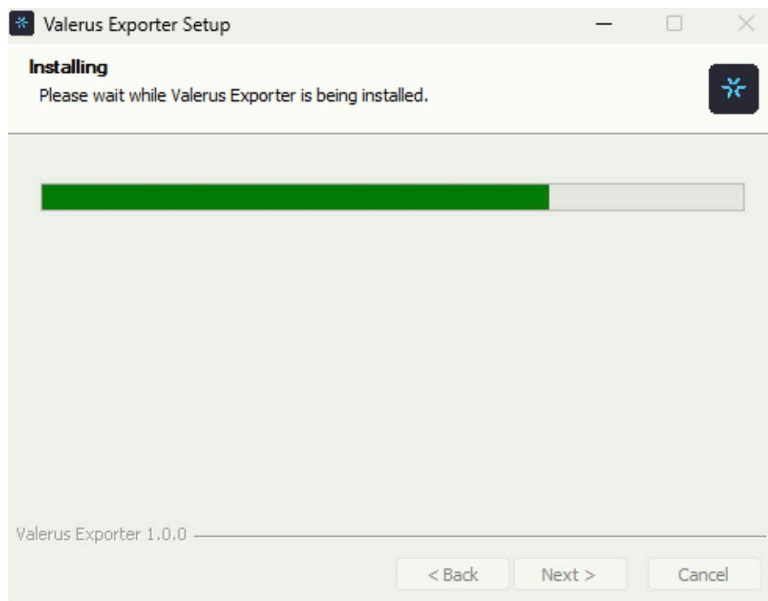

Installing the Valerus Exporter Tool

The Valerus Exporter Tool is compatible with Valerus version 24.1 and higher. It is available on Vicon's website under Valerus Software Downloads Add-ons and Tools. This tool can be installed on any PC from which you can access the App Server.

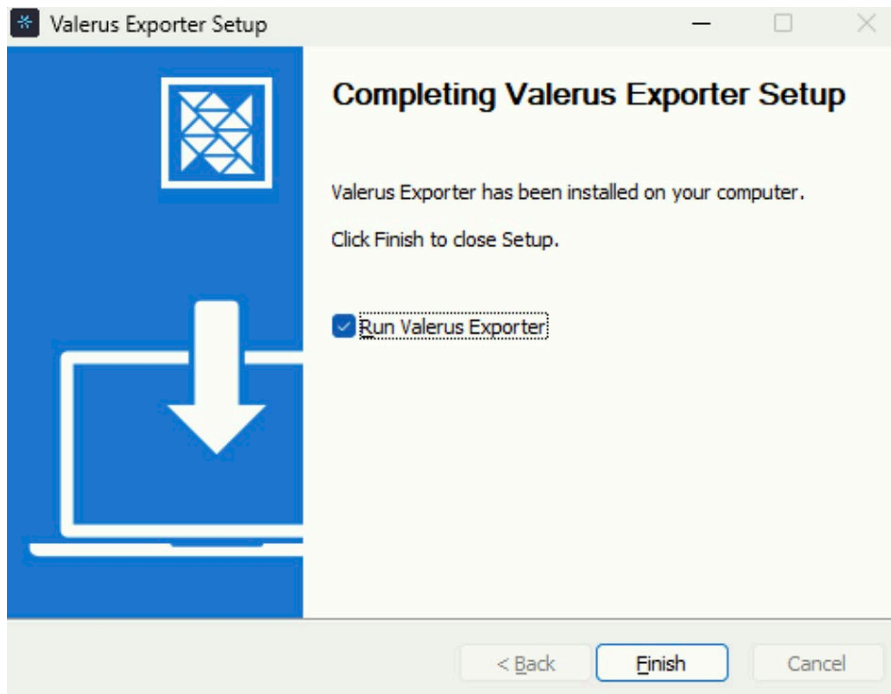

- Download the Valerus Exporter Tool and click to install. Select an installation location and click the Install button.

- The installation will begin. A status bar indicates the progress.

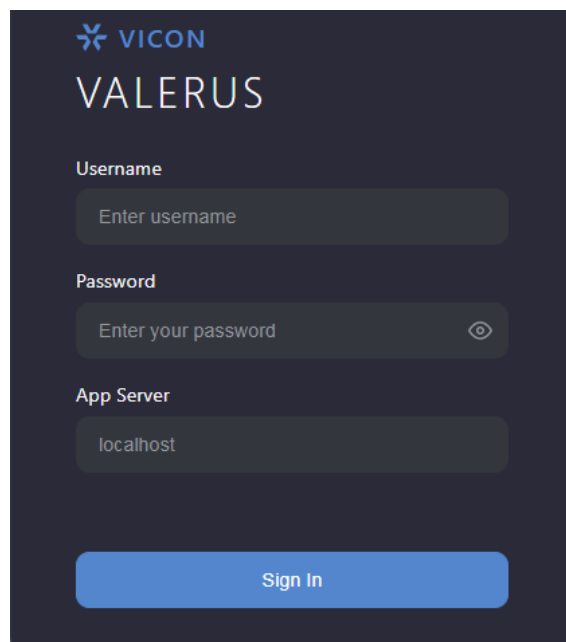

- The Completing screen displays. The Run Valerus Exporter is checked by default; it can be unchecked if needed. Click Finish.

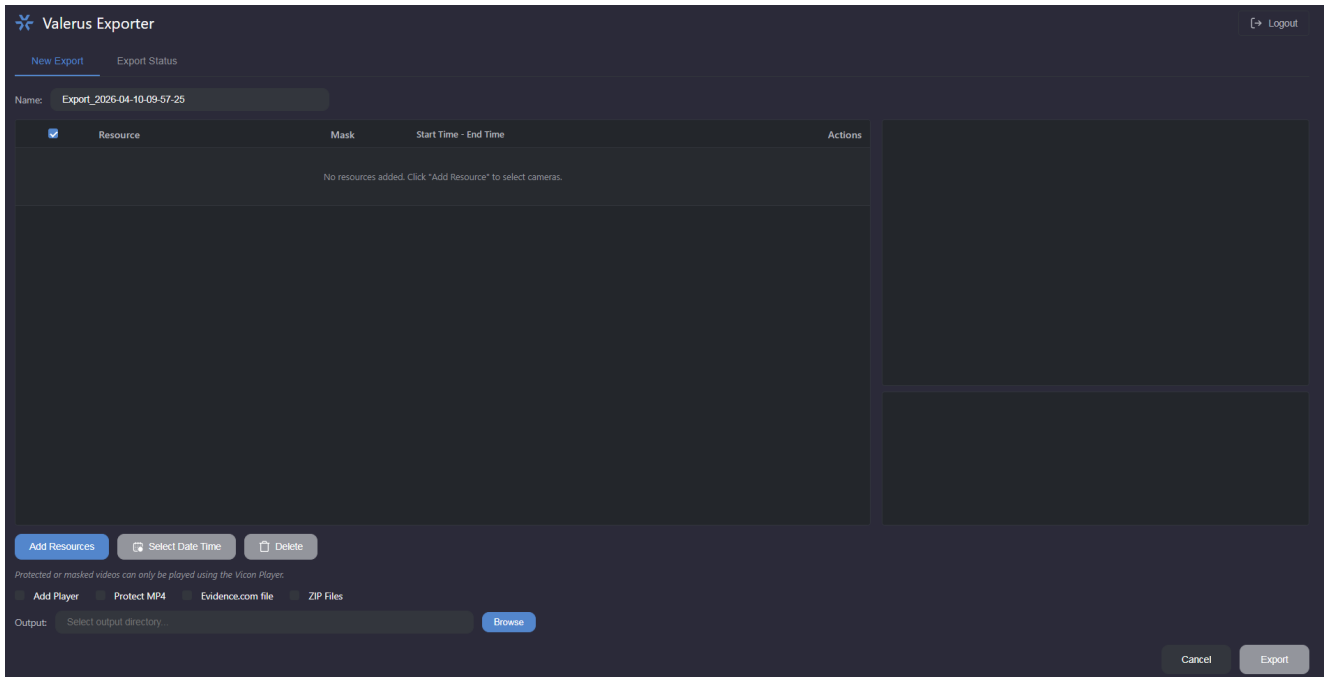

Using the Valerus Exporter Tool

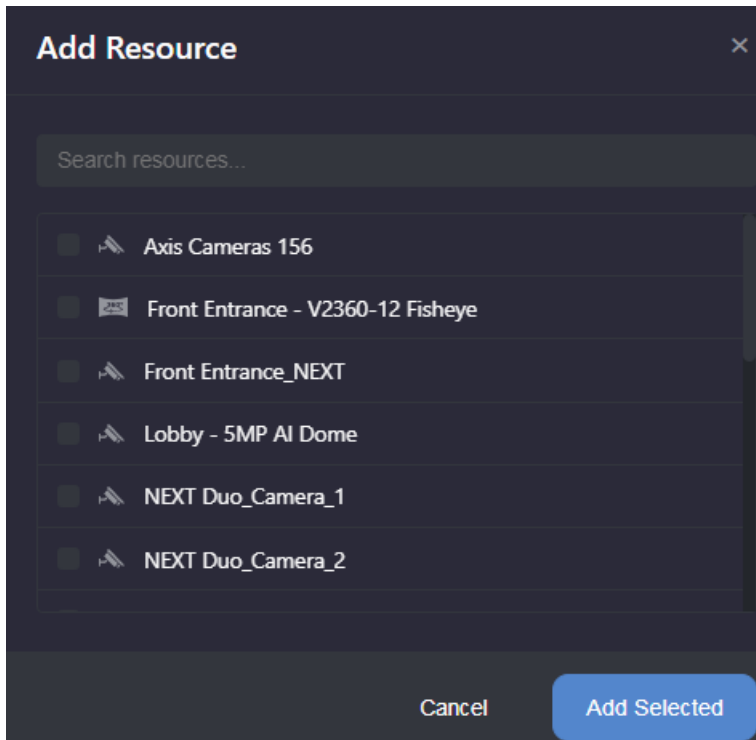

- When installation is complete, open the tool. Login to the Exporter tool using your Valerus username and password. Enter the App server information. Click Sign In.

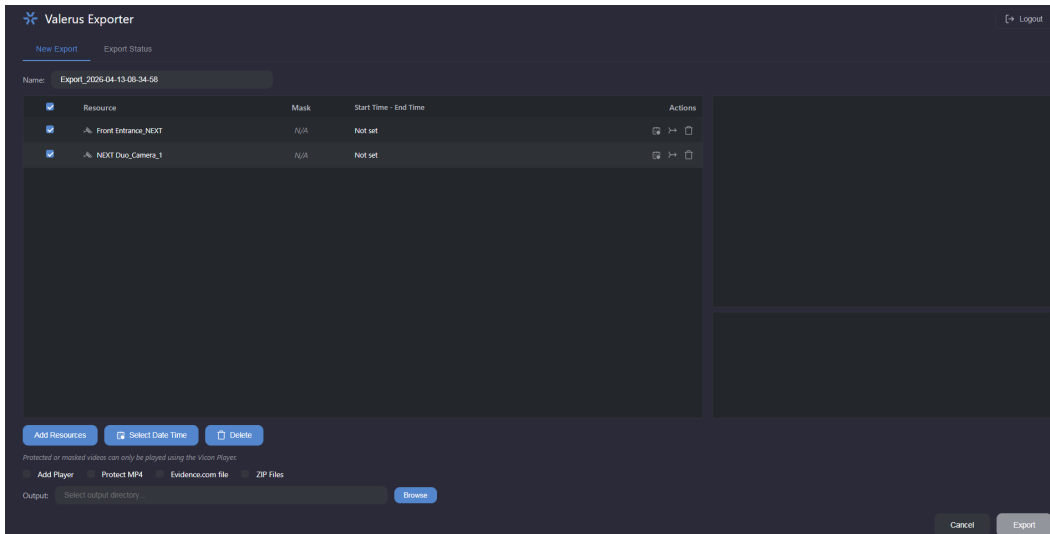

- The opening screen displays.

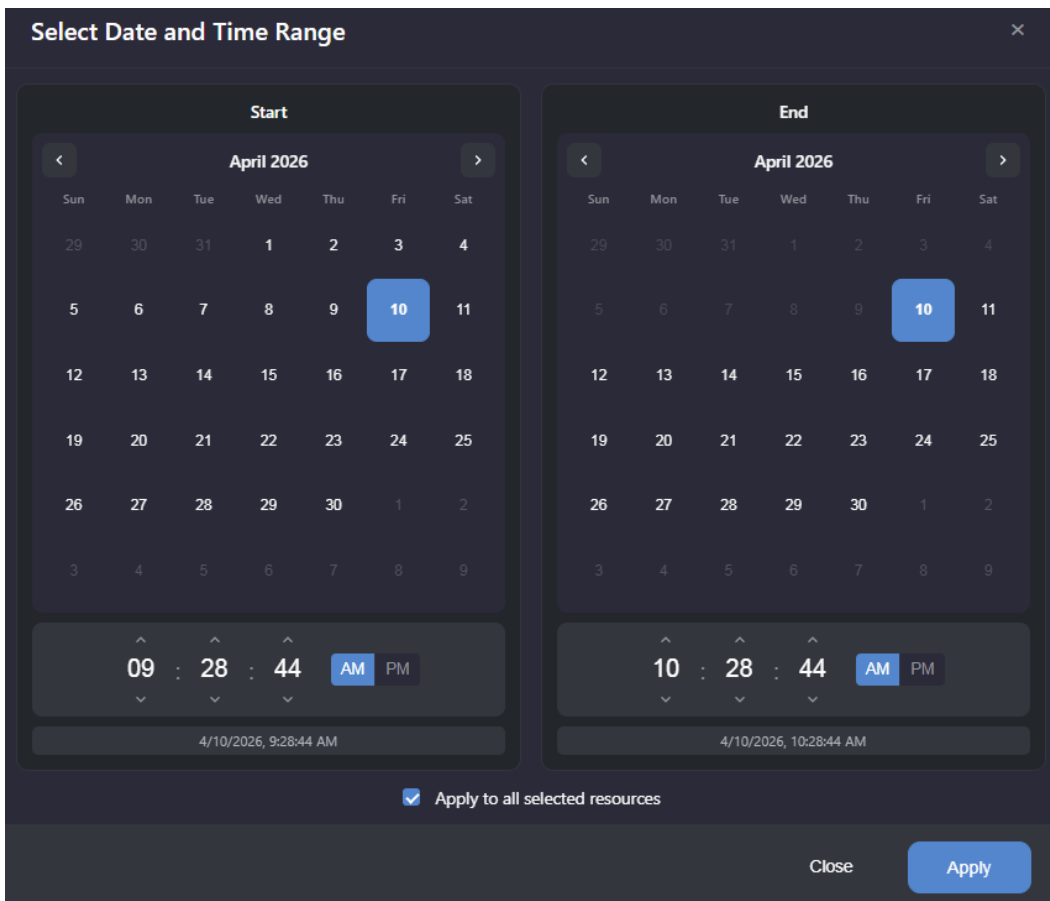

- Name the new export; the default name is the date and time. Click the Add Resources button at the bottom of the screen. A screen displays listing the available cameras. Select the camera(s) video to export and click the Add Selected button.

- These resources are now listed on the screen.

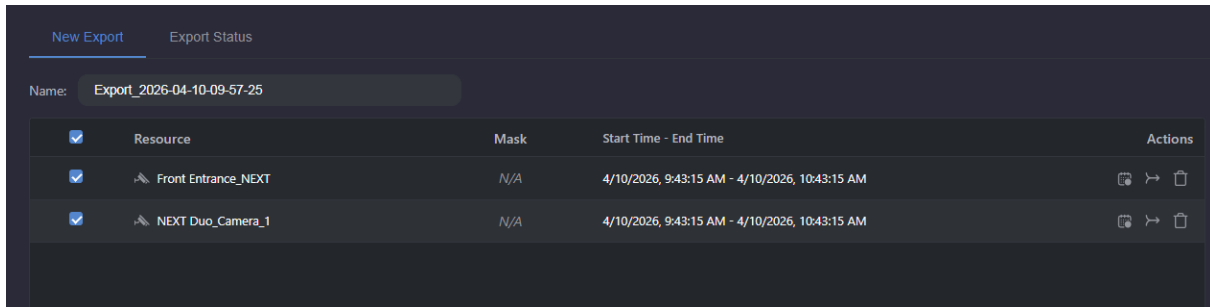

- Click the Select Date Time button at the bottom of the screen. The screen below displays.

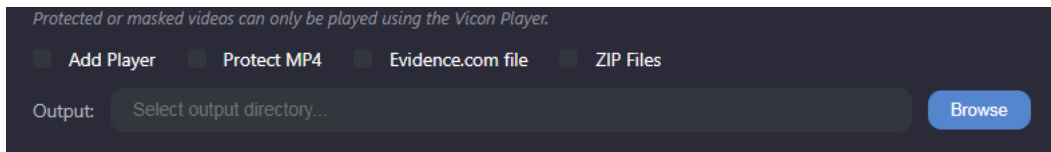

- Select Date range and time span you want to export. Click the Apply button. Apply to all selected resources button is checked by default.
- If there is a mask on any of the exported video, it can be removed from the exported clip by clicking the Mask button; the mask remains on the live video display.

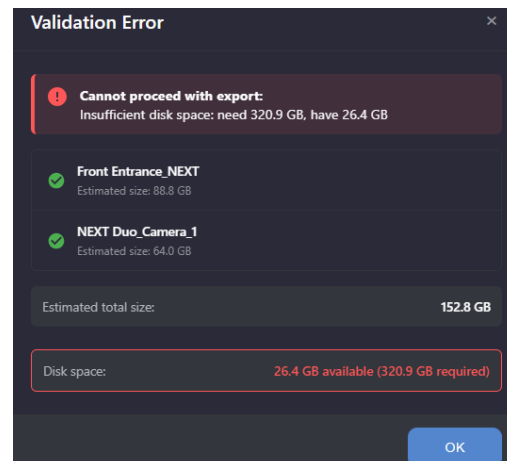

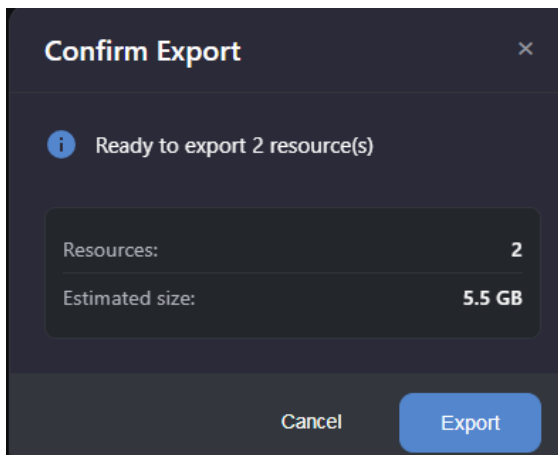

- Several actions can be taken with the files. Click the calendar icon to reset the Date/Time of the resources. Click the arrow icon to merge the Audio and Video into a single export, so they are properly synchronized. Use the garbage pail icon to remove the files.

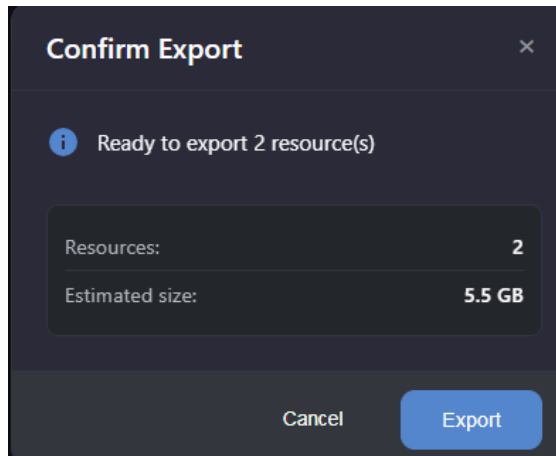

- Select the format of the export from Protect MP4, Evidence.com file or Zip Files. You can include the Player; this way video can be viewed as in the VMS. For added security, you can block the MP4 video from being played in external players (like VLC) by checking the Protect MP4 option. Evidence.com files will be .vicon files. Zip files can be password protected.
- Select the Output directory at the bottom of the screen. Use the Browse button as needed to select the location. Click the Export button to begin the export process; a Cancel button is provided to stop the process.

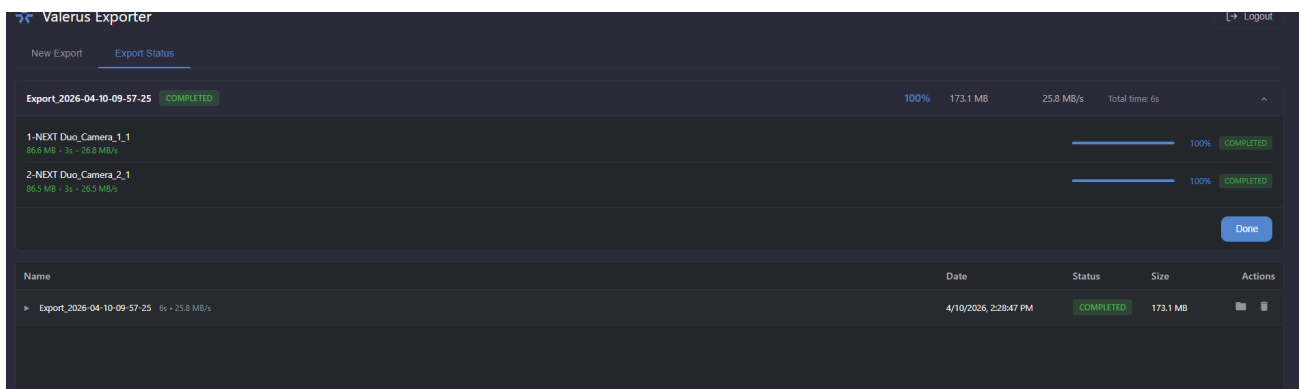

- The Delete button at the bottom of the screen is used to delete the added resources.
- The system will process the export. A confirmation screen displays. If there is any problem, like not enough disk space for the export, and Validation Error screen displays. Click OK to correct the problem.

- On the Confirm Export screen, click the Export button.

- After the Export is complete, you can see the status by selecting the Export Status tab. The screen will display as below.

- Click the Logout button at the top right of the screen to leave the Valerus Exporter tool.
